## AMENDMENT TO THE CLAIMS

The following claim set replaces all prior versions, and listings, of claims in the application:

- 1. (currently amended) Process for the preparation of melamine <u>comprising</u> <u>bringing together in wherein, by</u> a first mixing step <u>in which</u> at least two melamine-containing flows, originating from at least two different processes for the preparation of melamine <u>from urea</u>, <u>are brought into contact with each other, with to form</u> a mixture <u>being formed</u> thereof.
- 2. (currently amended) Process according to claim 1, wherein in which at least one melamine-containing flow contains gaseous and/or liquid melamine, and wherein the process further which comprises cooling the mixture in a cooling step, during or after the first mixing step, in which the mixture is cooled to a temperature below 250°C.
- 3. (currently amended) Process according to claim 2, wherein in which the cooling step is carried out by comprises bringing the mixture into contact with an aqueous phase.
- 4. (currently amended) Process according to claim 2, wherein in which at least one of the melamine-containing flows contains water as a the continuous phase, and wherein in which the cooling step is practiced earried out during the mixing step by supplying mixing the at least one melamine-containing flow which contains water as the continuous phase with at least one other melamine-containing flow.
- 5. (currently amended) Process according to claim 2, wherein in which the cooling step comprises is carried out by bringing the mixture into contact with gaseous and/or liquid ammonia.

TJIOE et al Serial No. 10/522,418 March 21, 2007

- 6. (currently amended) Process according to claim 1, wherein in which at least one of the melamine-containing flows flow contains melamine from a low-pressure gasphase process for the preparation of melamine, and at least one other of the melamine-containing flows flow contains melamine from a high-pressure liquid-phase process for the preparation of melamine.
- 7. (currently amended) Process according to claim 1, comprising a second mixing step, during or after the first mixing step, which comprises bringing the mixture in which the mixture is brought into contact with an aqueous phase, followed by a crystallization step which comprises cooling ; in which the mixture is cooled by at least 5°C to form ; with solid melamine being-formed, followed by a separation step comprising isolating in which the solid melamine is isolated from the mixture.
- 8. (currently amended) Process according to claim 7, <u>further comprising</u> <u>dissolving</u> in which virtually all the melamine is <u>dissolved</u> in a dissolving step during or after the second mixing step and prior to the crystallization step with the aid of heating and/o the addition of an aqueous flow.
- 9. (currently amended) Process according to claim 1, wherein in which at least one of the melamine-containing flows contains water as a the continuous phase, and wherein in which the mixture after the first mixing step is subjected to a crystallization step which comprises cooling , in which the mixture is cooled by at least 5°C to form ; with solid melamine being formed, followed by a separation step which comprises isolating , in which the solid melamine is isolated from the mixture.
- 10. (currently amended) Process according to claim 9, wherein in which the melamine-containing flow which contains water as the continuous, phase contains melamine originating from a low-pressure gas-phase process and is saturated to between 70% and 110% with melamine.

TJIOE et al Serial No. 10/522,418 March 21, 2007

- 11. (currently amended) Process according to claim 7, wherein in which at least one of the melamine-containing flows flow contains melamine from a low-pressure gasphase process for the preparation of melamine, and at least one other of the melamine-containing flows flow contains melamine from a high-pressure liquid-phase process for the preparation of melamine.
- 12. (currently amended) Process according to claim 8, wherein in which the mixture is subjected to a purification step after the dissolving step and prior to the crystallization step, and wherein the this purification step comprises: comprises:
  - treating the mixture a-treatment with NH<sub>3</sub> at a pressure between 1 MPa and 20 MPa and a temperature between 100°C and 250°C,
  - and optionally <u>conducting</u> an adsorption step and/or a filtration step.
- 13. (currently amended) Process according to claim 7, <u>comprising cooling</u> in which the mixture in the crystallization step is cooled to a temperature between 100°C and 25°C.
